Amendments to the Claims:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

Sub 7

- (Currently Amended) A rotating data storage disk system comprising:
 - a plurality of concentric tracks defined on a disk;
- said disk including at least two data storage areas, wherein each area is sized to store a copy of a set of data and the data storage areas are substantially equidistantly spaced from each other and wherein all of the at least two data storage areas are located within plus or minus one track of the same track;
 - a drive mechanism coupled to the disk; and
- a controller in communication with the drive mechanism for <u>maintaining</u> data coherency and keeping track of deferred writes to the at least two data storage areas of the disk.
- 2. (Original) The rotating data storage disk of claim 1 wherein the at least two data storage areas are located at radially opposed locations at a substantially 180 degree angular offset with respect to a spin axis of the rotating data storage disk and mirrored across the spin axis.
 - 3 (Canceled)
- (Original) The rotating data storage disk of claim 1 wherein the disk further comprises at least two magnetic recording surfaces, wherein the data storage areas are formed in a single one of the at least two magnetic recording surfaces.
- 5. (Original) The rotating data storage disk of claim 1 wherein the disk further comprises at least two magnetic recording surfaces, wherein the

HP Reference No. 200302135-1 Client Matter No. 68854.0175 Serial No: 09/855,483

data storage are as are formed in separate ones of the at least two magnetic recording surfaces.

- 6. (Original) The rotating data storage disk of claim 1 wherein the disk further comprises an optical recording surface.
- 7. (Original) The rotating data storage disk of claim 1 wherein the disk further comprises a magneto-optical recording surface.
 - 8. (Candeled)
 - 9. (Canceled)
- 10. (Previously Presented) The rotating data storage disk of claim 1 wherein the at least two data storage areas comprise "n" storage areas and the disk exhibits a characteristic virtual revolutions per minute (RPM) that is a multiple n of the actual spin speed of the rotating data storage disk.
 - 11. (Currently Amended) A disk drive system comprising:

one or more platters, each platter supporting at least one recording surface, wherein the platters are aligned about a common central axis;

a plurality of concentric tracks defined on the platter;

means for spinning the platters about the common central axis;

a recording head associated with each recording surface;

an actuator mechanism coupled to each recording head to move the recording head into proximity with selected portions of the recording surface in response to received commands; and

at least two replicates of data stored in at least two data storage areas such that any one of the at least two replicates can be accessed to service a

HP Reference No. 200302135-1 Client Matter No. 68854.0175 Serial No: 09/855.483

data access request and all of the at least two data storage areas are located within plus or minus one track of the same track; and

a controller for <u>maintaining data coherency</u> and keeping track of deferred writes to the data storage areas.

- 12. (Previously Presented) The disk drive system of claim 11 wherein the data storage areas are located so as to be mirrored about a spin axis of the platters.
 - 13. (Canceled)
- 14. (Original) The disk drive system of claim 11 wherein the data storage areas are formed in a single one of the one or more platters.
- 15. (Original) The disk drive system of claim 11 wherein the data storage areas are formed in separate platters of the one or more platters.
- 16. (Previously Presented) The disk drive system of claim 11 wherein each recording surface further comprises a plurality of concentric tracks defined on the recording surface and each track is substantially aligned with a corresponding track on an adjacent platter, wherein all of the at least two data storage areas are located on adjacent tracks.
 - 17. (Canceled)
- 18. (Previously Presented) The disk drive system of claim 11 wherein the at least two data storage areas comprise "n" storage areas and the disk exhibits a characteristic virtual revolutions per minute (RPM) that is a multiple n of the actual spin speed of the rotating data storage platter.
- 19. (Previously Presented) The disk drive system of claim 11 further comprising:

HP Reference No. 200302135-1 Client Matter No. 68854.0175 Serial No: 09/855.483

a command processor having an interface to receive external disk access requests and coupled to provide the disk access request to the actuator mechanism; and

memory coupled to the command processor and configured to store redundant write access request commands such that the at least two replicates can be stored asynchronously.

Claims 20-26

(Canceled)

- 27. (Currently Amended) A disk controller in communication with a disk comprising:
 - a command port for receiving disk access commands;
 - a command processor for executing software processes;
- a first process executing in the command processor for replicating a received disk access request, wherein the first process generates a replicated access request that refers to a disk track adjacent to a disk track referred to by the access request;
- a second process executing in the command processor for executing at least one of the received disk access request and replicated disk access request against a disk drive; and

means for <u>maintaining data coherency</u> and keeping track of deferred writes to the disk.

- 28. (Original) The disk controller of claim 27 wherein the first process comprises processes configured to cause the command processor to determine radially opposed locations within the disk suitable for the disk access request.
- 29. (Original) The disk controller of claim 27 wherein the first process comprises processes configured to cause the command processor to

HP Reference No. 200302135-1 Client Matter No. 68854,0175

Serial No: 09/855.483

determine locations on adjacent tracks within the disk suitable for the disk access request.

- 30. (Previously Presented) The disk controller of claim 28 wherein the second process receives the determined radially opposed locations and executes the at least dne disk access request at the determined location.
- (Original) The disk controller of claim 27 further comprising a 31. redundant data table holding one or more pending write access requests and coupled to the second process such that the second process can execute the received disk access request and the replicated disk access request asynchronously.
